Inclusive Jet Meeting

April 20, 2015

- Used two approaches to unfolding
- **Simple Unfolding**
  - Matching only within the same rapidity bins.
  - 8 transfer matrices  $46 \times 46$  ( $8 = \# \text{ } y\text{-Bins}$ ,  $46 = \# \text{ } p_T\text{-Bins}$ ).
  - Unfolding done for each transfer matrix separately.
- **2D Unfolding**
  - Matching between different rapidity bins allowed.
  - 1 transfer matrix  $368 \times 368$  ( $368 = 8 \times 46$ ).
- **Differences:**
  - Different transfer matrices.
  - Different matching efficiencies.

# Transfer matrices

## 2D unfolding

## Simple unfolding

# Slices in Transfer Matrix

# Matching Efficiencies

## Reco Jets

# Matching Efficiencies

## Truth Jets

# Unfolding Results

## Reco Spectra & 2D Unfolded Spectra / Truth Spectra

# Unfolding Results

## Simple Unfolded Spectra & 2D Unfolded Spectra / Truth Spectra

## Matching Efficiencies

2D Unfolding:  $> 99\%$  for almost every bin with  $p_T > 100$  GeV.

Simple Unfolding:  $\sim 2 - 5\%$  worse.

## Unfolding Results

Small differences between both of these approaches.
